

Indicator 16 Class Notes by Mrs. Joshi

Exponents

(AL Standard 14—I can write, evaluate, and compare numerical expressions with exponents.)

Vocabulary

base 2^5 power 2^5
exponent $2^5 \rightarrow$ exponent squared $5^2 = 5 \times 5 = 25$
exponential notation 2^5 cubed $5^3 = 5 \times 5 \times 5 = 125$
expanded form $2 \times 2 \times 2 \times 2 \times 2$
standard form $2^5 = 2 \times 2 \times 2 \times 2 \times 2 = 32$

Lesson 3.4 Exponents

$5^2 = 5 \times 5 = 25$
 $5^3 = 5 \times 5 \times 5 = 125$

Mrs. Joshi 10/2/12

$10^5 \rightarrow$ exponent
base
 $10 \times 10 \times 10 \times 10 \times 10 \rightarrow$ expanded form
 $100,000 \rightarrow$ standard form

12^3 twelve squared
 $12 \times 12 = 144$

$12 \times 12 \times 12 = 1728$

Exponents

The **exponent** of a number says **how many times** to use the number in a multiplication.

In 8^2 the "2" says to use 8 twice in a multiplication,
so $8^2 = 8 \times 8 = 64$

exponent
(or index,
or power)

base

8^2

In words: 8^2 could be called "8 to the power 2" or "8 to the second power", or simply "8 squared"

Exponents are also called Powers or Indices.

Indicator 16 Class Notes by Mrs. Joshi

Some more examples:

Example: $5^3 = 5 \times 5 \times 5 = 125$

- In words: 5^3 could be called "5 to the third power", "5 to the power 3" or simply "5 cubed"

Example: $2^4 = 2 \times 2 \times 2 \times 2 = 16$

- In words: 2^4 could be called "2 to the fourth power" or "2 to the power 4" or simply "2 to the 4th"

Exponents make it easier to write and use many multiplications

Example: 9^6 is easier to write and read than $9 \times 9 \times 9 \times 9 \times 9 \times 9$

You can multiply **any** number by itself **as many times** as you want using exponents.

Other Way of Writing It

Sometimes people use the ^ symbol (above the 6 on your keyboard), as it is easy to type.

Example: 2^4 is the same as 2^4

- $2^4 = 2 \times 2 \times 2 \times 2 = 16$

Indicator 16 Class Notes by Mrs. Joshi

What if the Exponent is 1, or 0?

1 If the exponent is 1, then you just have the number itself (example $9^1 = 9$)

0 If the exponent is 0, then you get **1** (example $9^0 = 1$)

But what about 0^0 ? It could be either 1 or 0, and so people say it is "indeterminate".

A LITTLE EXTRA CHALLENGE FOR ACCELERATED MATH

Negative Exponents

Negative? What could be the opposite of multiplying?

Dividing!

A negative exponent means how many times **to divide** one by the number.

Example: $8^{-1} = 1 \div 8 = 0.125$

You can have many divides:

Example: $5^{-3} = 1 \div 5 \div 5 \div 5 = 0.008$

But that can be done an easier way:

5^{-3} could also be calculated like:

$$1 \div (5 \times 5 \times 5) = 1/5^3 = 1/125 = 0.008$$

Indicator 16 Class Notes by Mrs. Joshi

More Examples:

Negative Exponent		Reciprocal of Positive Exponent		Answer
4^{-2}	=	$1 / 4^2$	=	$1/16 = 0.0625$
10^{-3}	=	$1 / 10^3$	=	$1/1,000 = 0.001$
$(-2)^{-3}$	=	$1 / (-2)^3$	=	$1/(-8) = -0.125$

It All Makes Sense

My favorite method is to start with "1" and then multiply or divide as many times as the exponent says, then you will get the right answer, for example:

Example: Powers of 5			
	.. etc..		
5^2	$1 \times 5 \times 5$	25	$5 \times$ Larger $5 \div$ Smaller
5^1	1×5	5	
5^0	1	1	
5^{-1}	$1 \div 5$	0.2	
5^{-2}	$1 \div 5 \div 5$	0.04	
	.. etc..		

If you look at that table, you will see that positive, zero or negative exponents are really part of the same (fairly simple) pattern.
