Area of Composite Figures-(AL 26, 26a, 25b, 25c)

I can find the area of composite shapes. (real-world and mathematical)

I can calculate the length of a side, perimeter and area of a polygon in the coordinate plane. (Only same x- or same y- coordinate)

To find the area of a composite figure, split it up into figures with areas you know how to find. Then add the areas of those figures.

EXAMPLE 1 Finding an Area Using Grid Paper

Each square on the grid paper is 1 square meter. Find the area of the yellow figure.

Count the number of squares that lie entirely in the figure. There are 45.

Count the number of half-squares in the figure. There are 5.

The area of a half-square is $1 \div 2 = 0.5$ square meter.

Area of 45 squares: $45 \times 1 = 45$ square meters

Area of 5 half-squares: $5 \times 0.5 = 2.5$ square meters

∴ So, the area is $45 + 2.5 = 47.5$ square meters.

Each square on the grid paper is 1 square inch. Find the area of the figure.

Answer:

3. 28.5 in.^2

4. 33 in.^2

5. 25 in.^2

6. 30 in.^2

7. 25 in.^2

8. 24 in.^2

Indicator 12
Areas of Composite Figures

Mrs. Joshi

Quadrilaterals

Square

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

$A = s \times s$
 $= s^2$
 $A = 4 \times 4$
 $= 16 \text{ unit}^2$

Rectangle

1	2	3	4	5	6
7	8	9	10	11	12
13	14	15	16	17	18

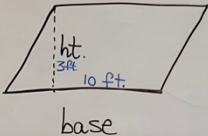

$A = \text{length} \times \text{width}$
 $A = lw$
 $A = 6 \times 3$
 $= 18 \text{ unit}^2$

Indicator 12
Areas of Composite Figures

Mrs. Joshi

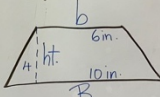

Quadrilaterals

Parallelogram

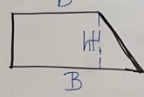

Area = base \times height
Area = bh
 $A = 10 \times 3$
 $= 30 \text{ ft.}^2$

Trapezoid

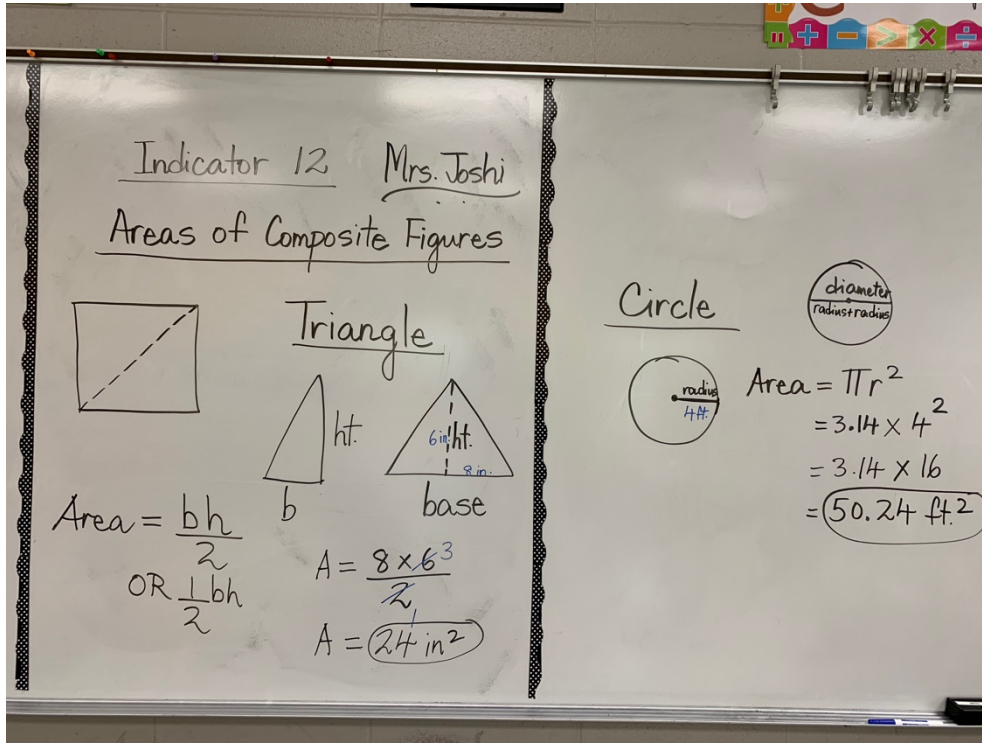

OR

$A = \frac{(B+b)h}{2} \rightarrow A = \frac{(10+6) \times 4}{2}$
 $= \frac{16 \times 4}{2}$
 $= 8 \times 4 = 32 \text{ in}^2$

EXAMPLE Find the Area of a Composite Figure

Find the area of the figure at the right.

The figure can be separated into a rectangle and a triangle. Find the area of each.

Area of Rectangle

$$A = bh$$

$$A = 10 \cdot 6 \text{ or } 60$$

Area of Triangle

$$A = \frac{1}{2}bh$$

$$A = \frac{1}{2}(4)(4) \text{ or } 8$$

The base of the triangle is $10 - 6$ or 4 inches.

The area is $60 + 8$ or 68 square inches.

EXAMPLE 3 Finding an Area

Find the area of the figure.

The figure is made up of a triangle, a rectangle, and a parallelogram. Find the area of each figure.

Area of triangle

$$\begin{aligned} A &= \frac{1}{2}bh \\ &= \frac{1}{2}(11.2)(4.5) \\ &= 25.2 \end{aligned}$$

Area of rectangle

$$\begin{aligned} A &= \ell w \\ &= (8)(4.5) \\ &= 36 \end{aligned}$$

Area of parallelogram

$$\begin{aligned} A &= bh \\ &= (8)(6.7) \\ &= 53.6 \end{aligned}$$

So, the area is $25.2 + 36 + 53.6 = 114.8$ square centimeters.

Indicator 30 Class Notes by Mrs. Joshi

Find the area of the figure at the right.

The figure can be separated into a square and a rectangle. The shared rectangle, however, will be counted twice if the areas are added, so the area of the small rectangle, 6×7 or 42, must be subtracted from the total.

The area of the square is 12×12 or 144 square centimeters.

The area of the rectangle is 15×12 or 180 square centimeters.

The sum of the areas is $144 + 180$ or 324 square centimeters.

Since the small rectangle was counted twice, subtract its area from the total. $324 - 42 = 282$

So, the area of the figure is 282 square centimeters.

Real-World EXAMPLES

POOLS The diagram of the pool from the beginning of the lesson is shown below. Find the area of the pool's floor.

The figure can be separated into a rectangle and a trapezoid.

The area of the rectangle is 28×14 or 392 square feet.

The area of the trapezoid is $\frac{1}{2}(2)(4 + 6)$ or 10 square feet.

So, the area of the pool's floor is $392 + 10$ or 402 square feet.

Find the area of the figure.

12.

13.

Answer:

12. Area of rectangle: $A = \ell w = 13(8) = 104$

Area of triangle: $A = \frac{1}{2}bh = \frac{1}{2}(5)(6) = 15$

The area is $104 - 15 = 89$ square meters.

13. To find the area, draw a rectangle on the figure as shown.

Find the area of the large triangle, then subtract the area of the rectangle.

Area of large triangle: $A = \frac{1}{2}bh = \frac{1}{2}(7)(9) = 31.5$

Area of rectangle: $A = \ell w = 4(2) = 8$

The area is $31.5 - 8 = 23.5$ square inches.

Use the space below to show a composite figure with an area of 16 square inches made from a rectangle and a triangle.

Answer:

The best way to answer this would be to use the formulas for rectangle and triangle. If I take a rectangle with an area of length x width of $4 \times 2 = 8$ square units, then I need 8 square units of the triangle. The area of a triangle is base x height divided by 2 or $\frac{1}{2}$ base x height. In order to get 8 square units as the area of the triangle, I can already see based on my drawing below, that the base of the triangle is 4. So, I need to figure out that 4 times what number divided by 2 will give me 8. I know that $4 \times 4 = 16$ and $16/2=8$. Therefore, the height of the triangle needs to be 4 units. See drawing below. This is a sample drawing.
