Standards for Mathematical Practice for Parents

Practice Standard	How a child can use the practice standards	Questions to ask
Make sense of problems and persevere in solving them.	 I can make my own plan for solving the problem and stick with it even if it is difficult. I can check the reasonableness of my answer. I can solve it a second way to make sure I am right! 	 What plan can you make to solve this problem? Can you draw a picture or act out the problem? What information is in the problem and what are you trying to figure out?
Reason abstractly and quantitatively.	 I can use numbers and words to help make sense of problems. I can think about what each number represents. I can think about the relationships between the numbers in the problem. I can think about what property might be used to solve the problem. I can think about whether other operations might be used. 	 Can you explain what the numbers in the problem mean? How did you decide to use this operation?
Construct viable arguments and critique the reasoning of others.	 I can explain my thinking using objects, drawings or actions I can consider the thinking of other students I can ask questions to clarify my understanding I can make connections to other strategies 	 How could you prove that? How can we be sure? Is this like another problem you have solved before?
4. Model with mathematics.	 I can recognize math in everyday life and use it to solve problems. I can use pictures, words, objects or symbols to solve. I can use number lines, arrays or other models to help myself as I solve the problem or to represent my solution. 	 What model could you construct that might help you solve this problem? Can you visualize the action in this problem?

5. Use appropriate tools strategically.	 I can use math tools such as number lines, calculators, objects, tables, etc. to solve a problem. I can use estimates when problem solving. 	 What tools could we use to solve this problem? What information do you have that might help?
6. Attend to precision.	 I can be careful when I use math and clear when I share my ideas. I always think about whether my answer is reasonable! I try to be efficient and concise when I solve a problem. (this looks different at various grade levels) I can test my solution by solving a different way or by modeling the solution and checking for reasonableness. 	 How do you know your solution is reasonable? How could you test your solution to see if it accurately answers the problem?
7. Look for and make use of structure.	 I can see and understand how numbers and shapes are put together as parts and wholes. I look for patterns that can help me solve a problem. I think about other problems I have solved before and whether they can help me with this problem. I try to connect mathematical ideas. 	 What do you notice when? What patterns do you find in? What are some other problems that are similar to this one?
8. Look for and express regularity in repeated reasoning.	 I can notice when calculations are repeated and use these ideas to create a strategy. I think about whether patterns are always true in all situations. I can create rules for patterns. 	 Is this always true? What do you notice about? What is happening in this situation?
